

Standard Operating Procedure

Jobsite Housekeeping

Document No.	SOP-LV-HSK-001
Related Documents	SOP-LV-001, SOP-LV-003
Effective Date	July 13, 2026
Revision	Rev. 0 (reconstructed)
Jurisdiction	Ontario (OHSA, O. Reg. 213/91) — Manitoba Workplace Safety and Health Act where applicable
Applies To	All field technicians and subcontractors on Company job sites
Approved By	_____

NOTE ON THIS DOCUMENT:

This SOP was reconstructed after the original file could not be located. It follows the same topic and structure as the original but is newly drafted — review carefully before relying on it for training or compliance purposes.

1. Purpose

This procedure establishes minimum housekeeping standards for Company job sites to reduce trip, fall, and fire hazards, and to maintain a professional standard of work at commercial, institutional, and residential sites, including occupied schools.

2. Scope

This SOP applies to all technicians and subcontractors performing low-voltage and structured cabling work at any Company job site, for the duration of the work and at the end of each shift.

3. Responsibilities

Site Supervisor

- Confirms housekeeping standards are communicated to all technicians and subcontractors on site.
- Conducts periodic spot checks of work area condition, particularly at occupied or school sites.
- Has authority to stop work and require cleanup before work resumes if conditions are unsafe.

Field Technician

- Maintains a clean, organized work area throughout the shift, not only at the end of the day.
- Clears debris, packaging, and offcuts as work progresses rather than allowing it to accumulate.
- Reports any housekeeping-related hazard (blocked exit, spill, damaged flooring) to the Supervisor immediately.

4. During-Work Housekeeping

- Clear cable offcuts, jacket scraps, packaging, and zip-tie trimmings from walking surfaces regularly throughout the day — do not allow debris to accumulate until end of shift.
- Keep tools and materials staged in a defined area, not spread across the work area or walkways.
- Route cords, cables, and hoses away from walkways where practical; where crossing a walkway is unavoidable, use a cord cover or clear signage.
- Do not block emergency exits, fire extinguishers, electrical panels, or fire pull stations with tools, materials, or ladders at any time.
- Clean up spills (water, lubricant, drilling fluid) immediately and place warning signage until the area is dry.

5. Cable & Material Staging

- Store cable reels and spools upright and secured against rolling; do not leave loose reels in walkways or on stairs.
- Stage materials in a single defined location per work area, clear of doorways, walkways, and equipment access points.

- Break down and remove packaging (boxes, plastic wrap, pallets) from the work area promptly — do not allow it to accumulate.
- Where staging materials overnight at an occupied site, confirm placement with the site contact and store in a location that does not obstruct occupant use of the space.

6. Trip Hazard & Cord Management

- Identify and correct trip hazards (loose cable, tools, debris, uneven flooring materials) as part of routine work, not only at inspection time.
- Coil and store unused cords and cables when not actively in use rather than leaving them run out across the floor.
- Use cable management (hooks, ties, covers) to keep active runs organized and off walking surfaces wherever possible.

7. Waste & Debris Disposal

- Dispose of cut jacket scraps, packaging, and general debris in designated waste containers — not left on-site or in building waste receptacles not intended for construction debris, unless confirmed acceptable with the site contact.
- Segregate recyclable materials (cardboard, spools) from general waste where site facilities support it.
- Remove all Company-generated waste and debris from the site at the end of each work day unless other arrangements are confirmed with the site contact.

8. Tool & Equipment Storage

- Store tools in cases, bags, or a gang box when not in active use — do not leave tools loose on ladders, ceiling grids, or floor surfaces.
- Secure power tools, batteries, and chargers in a locked room, gang box, or vehicle at occupied sites, particularly schools, when unattended.
- Account for all tools and equipment at the end of each shift before leaving site.

9. Occupied Site & School Considerations

- Complete daily cleanup before students, staff, or the public return to a work area, particularly for work performed during or adjacent to occupied hours.
- Leave no tools, materials, ladders, or open ceiling tiles unattended in an area accessible to students, staff, or the public.
- Where work spans multiple days, secure the work area (locked room, barricade, signage) between shifts rather than leaving it openly accessible.
- Coordinate cleanup timing with the school or facility contact where custodial schedules or occupant use of the space require it.

10. End-of-Shift Checklist

- Work area cleaned, debris and packaging removed
- Tools and equipment accounted for and secured
- Cable and materials staged safely, not left in walkways
- Ceiling tiles, panels, or covers replaced where applicable
- Emergency exits, panels, and pull stations confirmed clear
- Site contact informed of work area status where required
